Abstract—This report outlines the initial frontend development of NSU ClubHub, a React-based platform that lets students log in, sign up, browse clubs and events, and access admin pages based on their role. Currently, the application is a functional demonstration utilizing dummy data and role-based views.

I. SYSTEM ARCHITECTURE & TECHNOLOGIES

The NSU ClubHub application is built using React and Vite. The frontend relies on several key files for its core logic:

- **main.jsx**: Serves as the application entry point.
- **App.jsx**: Handles the routing and main layout logic.
- **rolecontext.jsx**: Manages authentication, login/signup/logout actions, and role state.

The user interface is styled using a single `index.css` file for layout and spacing. The primary theme color applied is #97B8FFFF, ensuring a consistent and modern aesthetic.

II. CORE FEATURES & ROUTING

The application is structured around specific routes corresponding to primary functionalities:

- **Authentication**: The `/` route is the login page and the first screen for users. The `/signup` route provides a signup page with role selection.
- **User Experience**: After successful login, users reach the `/home` dashboard. They can view the club directory at `/clubs`, event calendars using `react-big-calendar` at `/calendar`, and recruitment info at `/recruitment`.

- **Administration**: The `/admin` and `/super` routes provide role-gated dashboards for club administrators and super administrators, respectively.

III. USER ROLES & AUTHENTICATION FLOW

Because this iteration serves as a frontend demonstration, accounts are stored in memory only and not backed by a production database. The system supports three distinct roles for testing:

- **Student**: Standard view accessing clubs, the calendar, and recruitment.
Demo account: student@northsouth.edu / student123
- **Club Admin**: Accesses the `/admin` route and specialized admin sidebar features.
Demo account: clubadmin@northsouth.edu / club123
- **Super Admin**: Accesses the `/super` route for a global system overview.
Demo account: superadmin@northsouth.edu / super123

IV. CURRENT STATUS & FUTURE WORK

The current frontend build is highly stable; `npm run lint` and `npm run build` both execute successfully, and the platform can be run locally using `npm run dev`.

However, there are known developmental limitations: authentication is frontend-only (and therefore insecure), data resets upon browser refresh, and there is currently no backend infrastructure. The immediate next steps for the project are to implement a robust backend API, integrate a persistent database, and establish secure authentication to transition the system toward a production-ready state.
